PROFESSIONAL SUMMARY

Software engineer and product builder working across desktop applications, developer tools, operating systems, and creative technology. Founder of **Northbyte Studios** — an independent studio building privacy-first, practical products with zero telemetry. I own the whole loop myself: product direction, interface design, engineering, testing, documentation, release. Right now that's an encrypted vault, two Linux operating systems, and a general-purpose programming language, all under one studio and one pair of hands.

PROJECTS

Nexus — Encrypted Personal Vault Jun 2026 – Present · Windows Desktop

- Cryptographic core:** AES-256-GCM authenticated encryption over an NXG1 container format, Argon2id key derivation, Windows Hello secondary unlock, in-app SHA-256-verified updater, portable mode.
- Trust posture:** zero telemetry, zero cloud, zero sync — every byte encrypted at rest, decrypted only in memory while unlocked.
- v11:** full UI rebuild across lock screen, media browser, credential/note detail, settings, updater — cryptographic core unchanged. Stack: C# / .NET 8 / WPF · AES-256-GCM · Argon2id.

Mission OS — Privacy-First Linux Distribution 2026 – Present · Linux, GPLv3

- Four pillars built into the OS itself: privacy-first, security-conscious, portable-first, offline-first. Debian Stable + KDE Plasma; installer authored in QML/Qt.
- Every advanced installer option (LUKS2, Secure Boot, TPM-sealed unlock, recovery keys) explains its benefit, limitation, and trade-off next to the toggle. 141/141 pixel checks passed on the installer foundation; 14 CTest + 13 runtime suites.
- Interactive concept demo live at atharvapatil.tech/mission-os/demo — boot sequence through a desktop with six real informational apps.

Kanvaz — Visual Reference Workspace Jun – Aug 2026 · Electron, MIT

- Plugin system with a main-process consent dialog — plugins register card types, ship themes, add Settings panels. Theme Creator ships as the reference plugin.
- Safer .kanvaz zip container with per-asset SHA-256 integrity hashes, detects tampering on load. Final release v4.2.2 — wound down cleanly, free forever, open source.

Veris — Security Investigation Platform Jun 2026 – Present · Windows, v1.0.0

- Deterministic analysis engine, no black-box AI scoring — AI is limited to a read-only explanation layer over the deterministic core. 3,100+ automated tests, fully offline. Stack: TypeScript / Node.js / SQLite.

Pursue OS — Investigation-Focused Linux OS 2026 – Present · Linux, Apache 2.0

- Built for OSINT, DFIR, secure research, and evidence-driven workflows. Two flagship surfaces: Investigation Terminal + Investigation Browser with integrated Tor. AI assists, never decides.

Obscura — Lua AST Toolkit for Roblox 2026 – Present · Lua, MIT

- v1.0.0 shipped with 340/340 tests passing. Free forever, no telemetry, no vendor lock-in.

repo-map — Engineering Intelligence CLI 2026 · TypeScript, MIT

- Published on npm as @p4inz-code/repo-map — ESM-first, zero native dependencies, 870+ tests. On hold at v2.2.0 while other projects take priority.

MINK — Programming Language 2026 · In Design

- General-purpose language focused on simplicity, safety, and reliability — borrowing what already works from existing languages instead of reinventing it.

EXPERIENCE

Northbyte Studios — Founder & Independent Software Studio 2026 – Present · Navi Mumbai (remote-friendly)

- Full-cycle ownership: product direction, architecture, engineering, UI/UX, testing, documentation, branding, release — all one person.
- Fixed principle stack on every product: no telemetry, no cloud lock-in, explain the trade-off on-screen, free-forever when it can be.

Freelance — Web, UX & Brand 2025 – Present

- Independent client work: web development, UI/UX, visual identity, 3D/VFX visualization. Includes a full production website build for a performing-arts academy.
- Short-loop (1–2 weeks), product build (4–8 weeks), and studio work (scoped by shot), depending on what the client needs.

TECHNICAL SKILLS

LANGUAGES	C#, C / C++, TypeScript, JavaScript, HTML, CSS, Lua / Luau, Bash
FRAMEWORKS	.NET 8, WPF, Avalonia UI, Electron, Node.js, Astro, Qt / QML, Debian Linux, Windows
SECURITY	AES-256-GCM, Argon2id, LUKS2, TPM, Secure Boot, Windows Hello, deterministic analysis engines
3D / VFX	Blender, Substance, DaVinci Resolve, lighting studies, product renders, motion & camera work
TOOLS	Git / GitHub Actions, VS Code, Visual Studio, FFmpeg, npm / pnpm, Cloudflare Pages

EDUCATION

B.Sc. Animation — D. Y. Patil University, Nerul, Navi Mumbai 2025 – 2028 · second year in progress

PHILOSOPHY

I'd rather ship something smaller that's actually finished than something bigger that's half-right — privacy-first by default, interfaces that explain themselves, code built to still make sense a year from now.

In practice: no telemetry, ever. Every advanced option explains its trade-off on-screen, not in a docs page nobody reads. I build, test, and ship everything myself, and I try to keep the version numbers honest.
